

## Village Green Center Subcommittee Descriptions

---

### Arrive As You Wish (Vehicle & Personal Modal Infrastructure)

**Summary:** The movement of people to and from various points within the Village and their unimpeded access to Village Green Center, coupled with the convenience of personal multimodal transportation, effects everyone and their connections to community life and places of employment, whether near or far. Properly designed transportation infrastructure is an integral aspect of our daily lives and one that requires frequent updating and maintenance.

The quality of Village Green Center’s infrastructure – streets, trails, sidewalks, intersections, and ease of access by vehicles and personal modes of transportation (walking, biking, seat scooters, and standing scooters), is essential to residents and visitors alike. While maintaining a high quality of transportation infrastructure is a challenge for any Village, growing communities must keep ahead of increased transportation needs, methods and trends.

Village Green Center must meet the challenge of ever-evolving desired modes of transportation and recreational amenities that accompany these emerging trends. Pedestrian and multimodal-friendly amenities at intersections, roadside bike lanes, and connections needed to improve walkability throughout the Village’s downtown, just to name a few, require a much more expansive view of what transportation means today.

**Focus:** This subcommittee will assess and identify opportunities to enhance the various modes of transportation methods and future needs supporting an active and well-connected community.
